APPARATUS AND METHOD FOR FISHING LINE SPLICING ABSTRACT OF THE DISCLOSURE

5

10

A splice system and method for linear connection of fishing lines include a female connector and a male connector. The female connector has an outer surface, first and second opposite ends, and a longitudinal axis. The first end is connected to a first fishing line section and the second end has an opening therein. The connector has a co-axial interior feature with a radial extent. The male connector has first and second opposite ends and a longitudinal axis. The second end is connected to a second fishing line section and the first end is configured for coaxial insertion into the opening of the female connector. The second end has a radial extent greater than the radial extent of the interior feature of the female connector. At least one of the connectors is resilient to allow passage of the second end of the male connector axially past the interior feature.
